

## erwin<sup>®</sup> Data Transformation (erwin DT)

## AT A GLANCE

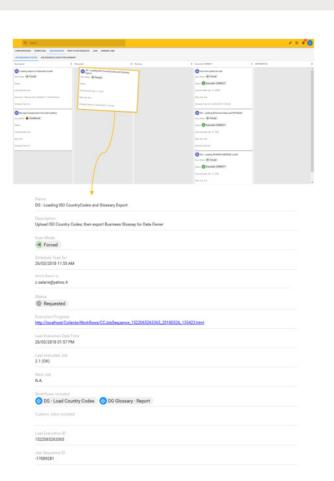

Data integration is a common enterprise data governance challenge. It's further complicated when dealing with metadata from such key operational systems for managing corporate risk/compliance, internal helpdesks, external customer service and enterprise architecture etc. Each of these systems have unique formats and data elements that become more valuable when they are visible and available for use. erwin DT makes it possible to synchronise and share data and metadata from an array of operational systems through a highly configurable and automated transformation and exchange capability.

## **KEY BENEFITS/RESULTS**

- Efficiently and effectively gather data scattered across a wide range of IT and corporate systems for an integrated data governance ecosystem (e.g., erwin Evolve, RSA Archer, ServiceNow, Veracode, etc.).
- Auto populate KPIs and architectural inventories to improve business processes and enterprise architecture.
- Easily transform complex collected data to match target requirements.
- Keep IT and other enterprise systems in sync and up to date through scheduling and automation.
- Automate time-consuming manual tasks and remediation.
- Easily federate disparate models for maximum visibility, ease of integration and traceability.

## SOLUTION OVERVIEW

- Native connectivity to a wide array of data sources, including ODBC as well as SOAP and REST, future proofs the data governance framework for harvesting
- Effectively federate disparate applications and information models, synchronize object lists in different models, maintain unique naming conventions, use complex keys to combine fields, calculate derived properties, and maintain metamodel independence.
- Easily manipulate source data to ensure easy ingestion and re-usability across disparate repositories and metamodels.
- Run jobs on demand via regular schedule or by predefined triggering events through a simple, intuitive interface.
- Simple and secure administration for users, jobs and projects enables agility, scalability and low overhead in terms of time, resources and maintenance.
